

Operation Guide

Operation Guide

1. This product is shipped without battery. On the back of the product there is a screw, unscrew the screw and install a CR2032 battery as the power source.
2. When the product is not in use, it is in the power-saving mode to minimize the power consumption. When any button is pressed, the MCU is woken up to transmit the corresponding RF signal and illuminate the LED. The button press time should be greater than 40ms. If the press time is less than 40ms, it may be regarded as noise and be ignored. Each time the button press is recognized, the data packet will be transmitted more than twice.
3. After the button is released, the remote control will stop transmitting the RF signal and turn off the LED. The product will enter the power-saving mode if no button is pressed for a period of time.
4. Troubleshooting: Each time the button is pressed, the LED will also be illuminated. If the LED is not illuminated, check the battery voltage level.
