

BC2302A/BC2302B Sub-1GHz Low-IF OOK RF Receiver

Features

Frequency bands:

 BC2302A: 315MHz, 433MHz
 BC2302B: 315MHz, 433MHz, 868MHz, 915MHz

• Operating voltage range: 2.5V~5.5V

• 0.5µA deep sleep current with data retention

· Low RX current:

3.2mA @ 433MHz

• 4.0mA @ 868MHz

• Good reception sensitivity under 0.1% BER

• -112dBm at 10Ksps @ 433MHz

• -111dBm at 10Ksps @ 868MHz

• Wide RF input power range: from sensitivity to +10dBm

• Up to 20Ksps symbol rate

• Support 2-wire I²C interface for operation configuration

• Support sniff application for lower power application

• Low cost package: 8-pin SOP-EP

Applications

• RF wireless ceiling lights/fans

· Keyless entry systems

• Smart home appliances

· Door remote controllers

· Other wireless products

General Description

The BC2302x receiver devices adopt a fully-integrated, low-IF OOK receiver with an automatic gain control (AGC) function and a fully-integrated OOK demodulator. The synthesizer is formed by an integrated VCO and a fractional-N PLL to support the 315, 433, 868, and 915MHz frequency bands. The devices only require a crystal and a minimum number of passive components to fully implement an OOK receiver. With this high level of functional integration, these devices provide excellent solutions for low-cost, low power wireless applications.

The devices achieve -112dBm and -111dBm sensitivity for the 433.92MHz and 868MHz bands, respectively. They operate from a supply voltage of 2.5 to 5.5V and typically require 3.2mA and 4.0mA at 433.92MHz and 868MHz, respectively. An agile RSSI threshold detection mechanism can further alleviate the impact of interference on OOK reception. There are two operation modes, one of which is the Auto RX mode. By properly setting certain PCB wirings, they can directly enter the RX mode. The devices also support a sniff RX mode, where the on/off RX mode function can be controlled by an MCU to achieve a lower than average power consumption using duty RX mode operation.

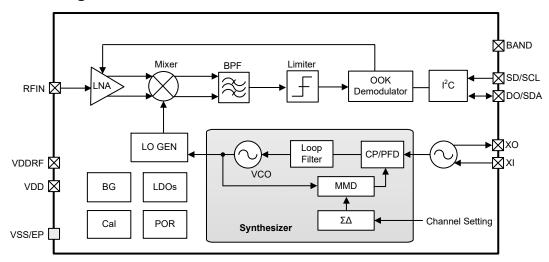

The BC2302 series offers two types of ICs. One is the BC2302A which covers the 315 and 433MHz bands while the BC2302B offers a choice of four frequency bands.

Selection Table

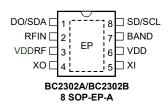

Part Number	Frequency Band					
BC2302A	315MHz, 433MHz					
BC2302B	315MHz, 433MHz, 868MHz, 915MHz

Pin Assignment

Pin Description

Pin No.	Pin Name	I/O	Description
1 DO/SDA ⁽¹⁾ DO I		DO	Demodulated data output in RX Mode
'	DO/SDAW	DI/DO	I ² C data line in Configuration Mode
2	RFIN	Al	RF LNA signal input
3	VDDRF	PWR	Analog positive power supply
4	XO	AO	Crystal oscillator output
5	XI	Al	Crystal oscillator input
6	VDD	PWR	Digital positive power supply.
7	BAND	DI	Pin option for frequency selection: GND: 315MHz (BC2302A/BC2302B) Floating: 433.92MHz (BC2302A/BC2302B) VDD: 868.35MHz (BC2302B only)
8	SD/SCL ⁽¹⁾	DI	RX mode shut-down control, should be pulled low in RX Mode
0	3D/3CL**	DI	I ² C clock input line in Configuration Mode
9	VSS/EP(2)	PWR	Exposed pad, must be connected to ground

Legend: DI=Digital Input DO=Digital Output
AI=Analog Input AO=Analog Output

PWR=Power

Note: 1. The DO/SDA & SD/SCL pins are default connected to a pull-high resistor after a power on reset. After entering the RX mode, these pull-high resistors are disconnected automatically. An analog debounce function is added to these two pins.

2. Pin 9 is the VSS/EP pin, located at the exposed pad.

Absolute Maximum Ratings

Supply VoltageV _{SS} -0.3V to 5.5V	Operating Temperature40°C to 85°C
Input Digital Voltage $V_{\text{SS}}0.3V$ to $V_{\text{DD}}\text{+-}0.3V$	ESD HBM> $\pm 2kV$
Storage Temperature50°C to 125°C	

^{*}Devices being ESD sensitive. HBM (Human Body Mode) is based on MIL-STD-883.

Note: These are stress ratings only. Stresses exceeding the range specified under "Absolute Maximum Ratings" may cause substantial damage to the device. Functional operation of this device at other conditions beyond those listed in the specification is not implied and prolonged exposure to extreme conditions may affect device reliability.

Functional Description

The BC2302x devices are ultra-low power, high performance, low-cost OOK receivers suitable for use in wireless applications with a frequency of 315, 433, 868, 915MHz respectively. The devices are formed by a low-IF receiver, followed by an OOK demodulator and a fractional-N synthesizer. They only require a crystal and a minimum number of passive components to implement an OOK receiver. These devices provide two operation modes. One is the Auto RX mode. By properly setting the PCB pin wirings, they can directly enter the RX mode. Another is the sniff RX mode where the on/off RX mode function can be controlled by an MCU to achieve a lower than average power consumption.

OOK RF Receiver

The BC2302x devices adopt a fully-integrated, low-IF receiver architecture. The received RF signal is first amplified by a low noise amplifier (LNA), after which the frequency is reduced to an intermediate frequency (IF). The IF signal is filtered by a channel-selected filter which rejects the unwanted out-of-band interference signals and image signal. After the BPF stage, the desired IF signal is amplified by the limiter amplifier which generates a received-signal-strength-indicator (RSSI) signal.

The devices feature an automatic gain control (AGC) unit which adjusts the front-end gain according to the RSSI. The AGC can increase the dynamic range of the RSSI and enable the devices to receive a wide dynamic range RF signal.

The OOK one/zero type data is generated by comparing the RSSI signal to a manipulated threshold. This threshold is crucial to the performance of OOK demodulation. The devices adopt an agile threshold detection mechanism. It can alleviate the impact of the interference on OOK reception quality. The agile threshold detection mechanism can reduce glitches when there is no RF signal or when long zero data streams are received. It also includes a fast tracking threshold to offer good immunity from co-channel interferences.

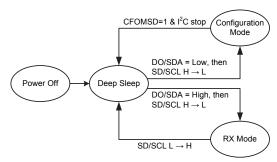

Operation Modes

The devices provide four operation modes, power off mode, deep sleep mode, RX mode and configuration mode.

In the deep sleep mode, there is less than $1\mu A$ of sleep mode leakage current with register data retention.

In the RX Mode, the devices execute normal RX operations that receive incoming RF signals from the antenna and then output the demodulated data onto the DO/SDA pin. There are two types of RX mode, one is the Auto RX mode and the other is the sniff RX mode.

In the Configuration Mode, the devices are operated as I²C slaves and are programmed by an external MCU. Users can select the desired RX channel by configuring the internal registers. After the configuration has completed, the devices will return to the deep sleep mode by setting the CFOMSD bit high.

Operation Mode Switching

Note: The CFOMSD bit will be cleared to zero automatically when the device leaves the configuration mode.

Mode	Register Retention	5V	Crystal Oscillator	Synthesizer &VCO	RX
Power Off	No	OFF	OFF	OFF	OFF
Deep Sleep Mode	Yes	ON	OFF	OFF	OFF
RX Mode	Yes	ON	ON	ON	ON
Configuration Mode	Yes	ON	ON	OFF	OFF

Auto RX Mode

The devices provide an Auto RX Mode. After poweron, the devices will enter the RX mode after a 30ms delay from the power-on reset. In this mode, frequency selection is achieved using a pin option together with external PCB wirings as shown in the following table.

BAND Pin	Selected Frequency For BC2302A	Selected Frequency For BC2302B
GND	315MHz	315MHz
Floating	433.92MHz	433.92MHz
V _{DD}	Unavailable	868.35MHz

To directly enter this mode, the SD/SCL pin should be connected to ground and the BAND pin should be connected to the required level before power is applied.

Note that there is only one method for the device to leave the RX mode which is to remove the power.

Sniff RX Mode

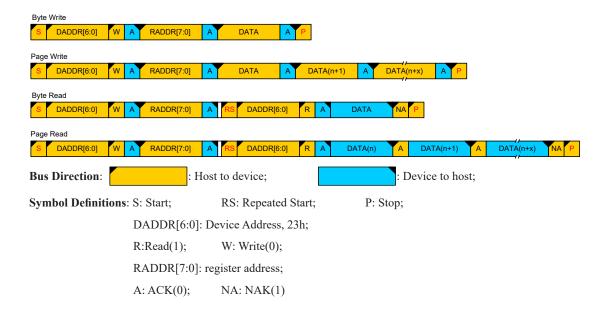

The devices also provide a Sniff RX mode as it is controlled by an MCU. The SD/SCL pin defaults

to a pull-high state. After power-on the devices will enter the deep sleep mode. An MCU could control the SD/SCL pin to make it enter or leave the RX mode. With additional SD/SCL control, users can optimize the average power consumption based on their applications.

Configuration Mode

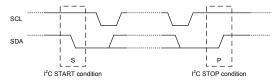

The devices include an I²C serial interface, which is used for bidirectional, two-line communication between multiple I²C devices. The two lines of this interface are the serial data line, SDA, and the serial clock line, SCL. Both lines are equipped with analog de-bounce functions. After a power on reset, these two pins are pulled to VDD by default using internal pull-high resistors. When entering the RX mode, the pull-high resistors are disconnected.

The devices support the I²C format for byte write, page write, byte read and page read formats. Every byte placed onto the SDA line must be 8-bits long. The number of bytes that can be transmitted per transfer is unrestricted. Each byte has to be followed by an acknowledge bit. Data is transferred with the most significant bit, MSB, first.

I²C START and STOP Conditions

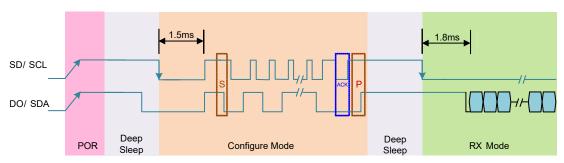

- A high to low transition on the SDA line while SCL is high defines a START condition.
- A low to high transition on the SDA line while SCL is high defines a STOP condition.
- START and STOP conditions are always generated by the master. The bus is considered to be busy after the START condition. The bus is considered to be free again a certain time after the STOP condition.

 The bus remains busy if a Repeated START (RS) is generated instead of a STOP condition. The START (S) and Repeated START (RS) conditions are functionally identical.

Configuration Mode Switching and Timing

As shown in the following diagram, when SDA is low and a SCL falling edge occurs, the device changes from the Deep Sleep Mode to the Configuration Mode after a 1.5ms delay time. If the SCL level remains high for a time greater than or equal to 20ms, the device will be forced to leave the Configuration Mode.

If the devices are connected to an MCU through an I²C interface, users can set the CFOMSD bit of the register, at address 42h, to leave the Configuration Mode.

Entering and Leaving Configuration Mode Timing Diagram

Register Map

When connected to an external MCU, the device's RF frequency can be setup using a series of internal registers in the Configuration Mode. The register data is written to and read from the devices using their internal I²C interface. The following provides a summary of all internal registers and their detailed descriptions.

Address	Register		Bit						
Address	Name	7	6	5	4	3	2	1	0
05h	CFG0				Setti	ing 0			
10h	OM	_	BAND_S	SEL[1:0]	_	_	_	_	_
11h	CFG1				Setti	ing 1			
12h	SX1	_				D_N[6:0]			
13h	SX2				D_K	[7:0]			
14h	SX3				D_K[[15:8]			
15h	SX4	_	_	_	_		D_K[19:16]	
17h	CFG2				Setti	ing 2			
18h	CFG3				Setti	ing 3			
19h	CFG4		Setting 4						
39h	CFG5			Setting 5					
42h	I2C1	_	_	_	_	_	_	_	CFOMSD

Register Map

For the CFG0~CFG5 registers, the recommended values are listed as follow.

Frequency Register	315MHz	433.92MHz	868.35MHz	915MHz				
CFG0	07h@	07h@Symbol rate ≤ 20Ksps; 04h@Symbol rate =20Ksps						
CFG1	B5h	B5h	B6h	B6h				
CFG2	7Fh	7Fh	7Fh	7Fh				
CFG3	74h	74h	D0h	D0h				
CFG4	8Dh	8Dh	91h	91h				
CFG5	C2h	C2h	C2h	C2h				

• OM – Operation Mode Control Register (Addr: 10H)

Bit	7	6	5	4	3	2	1	0
Name	_	BAND_SEL[1:0]		_	_	_	_	_
R/W	_	R/W		_	_	_	_	_
POR	0	0	0	0	0	0	0	0

Bit 6~5 **BAND_SEL[1:0]**: Band selection

00: 300~360MHz Band 01: 390~450MHz Band

10: Reserved

11: 850~935MHz Band - BC2302B only

Note that for the BC2302A, these two bits cannot be set to "10"/"11"

Bit 4~0 Reserved bit, cannot be changed

• SX1 - Fractional-N Synthesizer Control Register 1 (Addr: 12H)

Bit	7	6	5	4	3	2	1	0
Name	_	D_N[6:0]						
R/W	_		R/W					
POR	0	0	1	0	1	0	1	1

Bit 7 Reserved bit, cannot be changed

Bit 6~0 **D_N[6:0]**: RF channel frequency integer number code

$$D_N[6:0] = Floor~(\frac{f_{RF}-f_{IF}}{f_{XTAL} \div 2} \times 0.8) \times M,~(315MHz:~M=2,~Other~Bands:~M=1)$$

For example:

 $f_{XTAL}\!\!=\!\!16MHz,\,RF\;channel\;frequency(f_{RF})\!\!=\!\!315MHz,\,Intermediate\;Frequency\;(f_{IF})\!\!=\!\!200kHz$

- \rightarrow (315MHz-0.2MHz)/(16MHz/2)×0.8×2=62.96
- \rightarrow D_N=62
- \rightarrow Dec2Bin(62)=011 1110

 f_{XTAL} =16MHz, RF channel frequency(f_{RF})=433.92MHz, Intermediate Frequency (f_{IF})=200kHz

- \rightarrow (433.92MHz-0.2MHz)/(16MHz/2)×0.8=43.372
- \rightarrow D N=43
- \rightarrow Dec2Bin(43)=010_1011

• SX2 - Fractional-N Synthesizer Control Register 2 (Addr: 13H)

Bit	7	6	5	4	3	2	1	0
Name	D_K[7:0]							
R/W	R/W							
POR	1	0	1	1	0	1	1	1

Bit 7~0 **D_K[7:0]**: RF channel frequency fractional number code lowest byte

• SX3 - Fractional-N Synthesizer Control Register 3 (Addr: 14H)

Bit	7	6	5	4	3	2	1	0
Name	D_K[15:8]							
R/W	R/W							
POR	1	1	1	1	0	0	1	1

Bit 7~0 **D** K[15:8]: RF channel frequency fractional number code medium byte

• SX4 - Fractional-N Synthesizer Control Register 4 (Addr: 15H)

Bit	7	6	5	4	3	2	1	0
Name	_	_	_	_	D_K[19:16]			
R/W	_	_	_	_	R/W			
POR	0	1	1	0	0	1	0	1

Bit 7~4 Reserved bit, cannot be changed

Bit 3~0 **D** K[19:16]: RF channel frequency fractional number code highest byte

$$D_K[19:0] = Floor \ \{(\frac{f_{RF} - f_{IF}}{f_{XTAL} \div 2} \times 0.8 \times M - D_N[6:0] \times 2^{20}\}, (315MHz: M=2, Other \ Bands: M=1) \times 10^{-1} + 1$$

For example:

f_{XTAL}=16MHz, RF channel frequency(f_{RF})=315MHz, Intermediate Frequency (f_{IF})=200kHz

- \rightarrow (315MHz-0.2MHz)/(16MHz/2)×0.8×2=62.96
- \rightarrow D K=0.96×2²⁰=1006632
- → Dec2Bin(1006632)=1111_0101_1100_0010_1000

f_{XTAL}=16MHz, RF channel frequency(f_{RF})=433.92MHz, Intermediate Frequency (f_{IF})=200kHz

- \rightarrow (433.92MHz-0.2MHz)/(16MHz/2)×0.8=43.372
- \rightarrow D K=0.372×2²⁰=390070
- → Dec2Bin(390070)=0101_1111_0011_1011_0110

I2C1 – I²C Control Register 1 (Addr: 42H)

Bit	7	6	5	4	3	2	1	0
Name	_	_	_	_	_	_	_	CFOMSD
R/W	_	_	_	_	_	_	_	R/W
POR	0	0	0	0	0	0	0	0

Bit 7~1 Reserved bit, cannot be changed

Bit 0 **CFOMSD**: Configuration Mode shut down control

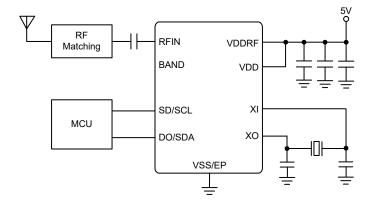

0: No operation

1: Exit Configuration Mode

In the configuration mode the devices can be forced to leave this mode by first setting the CFOMSD bit high and then followed by an I²C stop condition. After leaving the Configuration Mode the CFOMSD bit will be reset to zero automatically.
